scroll(1) -- Linux manual page

NAME

scroll - file viewer

SYNOPSIS

scroll *file…*

DESCRIPTION

scroll is a program which is used to either look through a file one screenful at a time, or to slowly scroll through the file line by line.

COMMANDS

SPACE   Display one screenful of text, if scrolling is enabled, this disables it and moves forward one screenful.

ENTER   Toggle scrolling line by line

f   (while scrolling) Toggle scrolling 20% faster

s   (while scrolling) Toggle scrolling 20% slower

q   Quit program

ENVIRONMENT

The **scroll** command may modify the **terminal** characteristics, however, any settings that are modified are returned to the original upon exiting the program.

NOTES

The **scroll** command should be able to take input from stdin if no file is given, this feature has not been implemented.
